GENERAL INFORMATION
INTRODUCTION

This Body Repair Manual provides detailed repair procedures for repair of commonly damaged structural panels on the Hyundai Getz. To aid in the information of the damaged vehicle, body construction, replacement parts, body dimensions, body sealing locations, corrosion protection and body repair procedures are contained herein.

The repair procedures specify locations where body members may be structurally sectioned. All of the repair procedures have been performed on Hyundai Getz body shells and that is currently available in most auto body repair shops.

The repair procedures illustrated in this manual were developed to simplify body repair in order to reduce insurance costs, and indirectly, cost of ownership.

The vehicle should not be sectioned in locations other than those illustrated in this repair manual. Furthermore, these repair procedures DO NOT apply to any other vehicle. The individuals performing the work must assume full responsibility for the quality of their workmanship.

We believe this manual to be helpful for Hyundai dealers, and anticipate it to be effectively used for Hyundai vehicle bodies.

For the services of other than collision-damaged body parts of the Hyundai Getz, refer to the Getz shop manual.

The illustrations and descriptive text in this manual were correct at the time of printing. It is the policy of HYUNDAI MOTOR COMPANY to continuously improve its products. Specifications and procedures are subject to change at any time without notice.

June 2002, Printed in Korea
GENERAL INFORMATION - General guide lines and precautions

GENERAL GUIDE LINES AND PRECAUTIONS

The Hyundai Getz is a completely new vehicle design. During its development, close attention has been given to safety, stability, weight and corrosion protection. Typical of unit body design, the Hyundai Getz is designed so that the front and rear compartments will absorb much of the collision energy so that the passengers are better protected. During collisions, these front and rear energy absorbing systems may be severely damaged. During repair, these damaged areas must be returned to their original strength and geometry. If this is not properly done, the vehicle will not provide the intended level of protection to its occupants in the event of another collision.

The repairs described in this manual were performed on Getz body shells. In some instances special fixtures were welded in place to support the structure. During the repair of an actual vehicle, the interior would be fully disassembled and standard jack screws or portable braces may be used for temporary support.

During the repair of an accident involved vehicle, the vehicle must first be returned to pre-impact dimensions prior to beginning the sectioning repair procedures. The extent of damage that must be repaired should then be evaluated to determine the appropriate repair procedures. This manual provides locations and procedures where structural sectioning may be employed. It is the responsibility of the repair technician, based upon the extent of damage, to determine which location and procedure is suitable for the particular damaged vehicle.

During the repair of a collision damaged automobile, it is impossible to fully duplicate the methods used in the factory during the vehicle manufacture. Therefore, auto body repair techniques have been developed to provide a repair that has strength properties equivalent to those of the original design and manufacture.

Certain guidelines and precaution are noted as follow.
The Hyundai Getz is equipped with a Supplemental Restraint System AIR-BAG to provide the vehicle's driver and/or the front passenger with additional protection than that offered by the seat-belt system alone, in case of a frontal impact of sufficient severity.

When handling airbag components (removal, installation or inspection, etc.), always follow the directions given in the repair manual for the relevant model to prevent the occurrence of accidents and airbag malfunction.

Also take the following precautions when repairing the body:

1. Work must be started after approximately 30 seconds or longer from the time the ignition switch is turned to the LOCK position and the negative (-) terminal cable is disconnected from the battery. (The airbag system is equipped with a back-up power source so that if work is started within 30 seconds of disconnecting the negative (-) terminal cable of the battery, the airbag may be deployed.) When the negative(-) terminal cable is disconnected from the battery, memory of the clock and audio systems will be cancelled. So before starting work, make a record of the contents memorized by the audio memory system. Then when work is finished, reset the audio system as before and adjust the clock.

2. When using electric welding, first disconnect the air-bag connectors under the steering column near the MULTI-FUNCTION SWITCH and the passenger's side crash pad before starting work.

3. Store the air-bag modules where the ambient temperature remains below 93°C (200°F), without high humidity and away from electrical noise.

4. WARNING/CAUTION labels are attached to the periphery of the air-bag components.

Refer to the Getz SHOP MANUAL.
GENERAL INFORMATION - Electronic parts

ELECTRONIC PARTS

Vehicles today include a great many electronic parts and components, and these are in general very susceptible to adverse effects caused by overcurrent, reverse current, electromagnetic waves, high temperature, high humidity impacts, etc.

In particular such electronic components can be damaged if there is a large current flow during welding from the body side.

Therefore, take the following precautions during body repair to prevent damage to the CONTROL MODULS (ECM, TCM, ABS CM, SRS CM, etc.)

1. Before removing and inspecting the electrical parts or before starting electric welding operations, disconnect the negative (-) terminal cable from the battery.
2. Do not expose the CONTROL MODULS to ambient temperatures above 80°C (176°F).
   
   **NOTE:**
   
   If it is possible the ambient temperatures may reach 80°C (176°F) or more, remove the CONTROL MODULS from the vehicle before starting work.
3. Be careful not to drop the CONTROL MODULS and not to apply physical shocks to them.

CORROSION PROTECTION AND SEALING

Proper corrosion protection and sealing is an important part of any repair. When reviewing these repair procedures, it is important to recognize the need for corrosion restoration to provide for long term strength of the repaired member.

A two part epoxy primer was applied to the metal surfaces during the latter part of the repair. For closed sections, such as front and rear rails, rocker panels and pillars, the primer is applied without applying the metal conditioner and the conversion coating. These steps are omitted to insure that no rinse water is trapped in the closed sections. The primer application is followed by an application of an oil or wax based rust proofing material.

After the corrosion restoration process for the closed sections are completed, then the process can be applied to all exterior sections. For exterior surfaces, both metal conditioner and conversion coating treatments are applied to the exterior surface prior to application of the epoxy primer. The procedure in applying the corrosion restoration process is important order to insure that moisture, due to the water rinsing of the metal conditioner and conversion coating is not inadvertently trapped inside any closed section before the epoxy primer and rust proofing materials have been applied.

Appropriate seam sealers are then applied to all joints. Follow manufacturer's recommendations for the appropriate type of seam sealer to be used at each seam or joint.

SIDE BODY PANELS

The side body panel for Getz is designed and stamped from a single piece of sheet metal in factory as shown in the figure. While the entire side panel is available for service, the partial panels sectioned by several damaged areas are also available. Therefore when repairing side body, refer to "Replacement parts section" of this manual to select and use the appropriate part.

---

[Diagram of side body panel]
WELDING

All repairs in this manual require the use of a Metal-Inert Gas (MIG) welder. Gas (oxyacetylene) welding must not be used.

Both high strength steel and mild steel can be welded using the MIG welder. The I-CAR recommendations for welding should be followed. The shielding gas should be 75% Argon and 25% CO2. The recommended welding wire size is 0.23" and the wire should satisfy the American Welding Society standard code AWSER70S-6.

During the repair process, plug welds are used to duplicate original factory spot welds. All plug welds should be done with the MIG welder. An 8 mm (5/16") hole is placed in the top (welding side) sheetmetal.

You then begin welding along the edges and the spiral towards the center (see illustration). This is important so that weld penetration between the two metal pieces takes place along the circumference of the circle.
BODY
CONSTRUCTION
BODY COMPONENTS

Body construction will sometimes differ depending on specifications and country of destination. Therefore, please keep in mind that the information contained herein is based on vehicles for general destination.

REPLACEMENT PARTS
REPLACEMENT PARTS

The following section illustrates replacement parts used in the repairs described in this manual. It is important that only Hyundai replacement parts be used in making these repairs to ensure the repairs are made with the highest possible standards for fit, safety and corrosion protection.

For a more complete listing of service parts, refer to an authorized Hyundai dealership.

BODY
DIMENSIONS
GENERAL

1. Basically, all measurements in this manual are taken with a tracking gauge.
2. When a measuring tape is used, check to be sure there is no elongation, twisting or bending.
3. For measuring dimensions, both projected dimension and actual-measurement dimension are used in this manual.

MEASUREMENT METHOD

PROJECTED DIMENSIONS

1. These are the dimensions measured when the measurement points are projected into the reference plane, and are the reference dimensions used for body alterations.
2. If the length of the tracking gauge probes are adjustable, make the measurement by lengthening one probe by the amount equivalent to the difference in height of the two surfaces.

ACTUAL-MEASUREMENT DIMENSIONS

1. These dimensions indicate the actual linear distance between measurement points, and are the reference dimensions for use if a tracking gauge is used for measurement.
2. Measure by first adjusting both probes to the same length (A=A‘)

NOTE
Check the probes and gauge itself to make sure there is no free play.

MEASUREMENT POINT

1. Measurements should be taken at the hole center.
* These dimensions indicated in this figure are actual-measurement dimensions.

---

**BODY PANEL REPAIR PROCEDURE - Fender apron and front side member (Assembly)**
NOTE
Before repairing, remove Engine and Suspension Components. Refer to the body dimension charts and measure the vehicle to determine straightening and alignment requirements. The body must be returned to its original dimension before you begin the repair procedure.

REMOVAL
1. Drill out all the spotwelds to separate cowl side upper outer panel from front side member.

   NOTE
   When spotwelded portions are not apparent, remove paint with a rotary wire brush.

2. Remove Co₂ weld points using a grinder.

3. Drill out all the spotwelds attaching the cowl side upper outer panel.

   NOTE
   If it is possible that the cowl side upper outer panel is reusable, be careful not to damage it while removing.
4. Using a spotweld cutter, drill out all the spotwelds attaching the fender apron to the dash panel and front side member.

5. Remove the fender apron panel.

NOTE
If collision damage requires replacement of fender apron and front side member together, remove both of them at the same time.

6. Using a spotweld cutter, remove the front side member by drilling out the spotwelds.

7. Grind and smooth any weld traces which might be left on the body surface by using an air grinder or similar tool, being careful not to damage any of the panels which is not to be replaced.
8. Using a hammer and dolly, correct any flanges that become bent or deformed when spotwelds are broken.

**INSTALLATION**

1. Drill 8 mm holes in the new fender apron and front side member for MIG plug welding.
2. Remove paint from both sides of all portions that are to be welded such as peripheries of MIG plug weld holes.

3. Temporarily install new parts in place.
4. Measure each measurement point (Refer to the BODY DIMENSIONS) and correct the installation position.
5. MIG plug weld all holes

6. Clean MIG welds with a disc grinder.

**NOTE**
1. Be careful not to grind welded portions too much.
2. The internal parts will be stronger if the weld traces are not ground.

7. Before welding the cowl side upper outer panel, apply the two part epoxy primer and anti-corrosion agent to the interior of the fender apron panel.
8. Install the cowl side upper outer panel in place.
9. MIG plug weld all holes.
10. Clean and prepare all welds, remove all residue.
11. Apply the two part epoxy primer to the interior of the each panel.

12. Apply an anti-corrosion agent as required (Refer to the CORROSION PROTECTION).
13. Prepare the exterior surfaces for priming using wax and grease remover.
14. Apply metal conditioner and water rinse.
15. Apply conversion coating and water rinse.
16. Apply the two-part epoxy primer.

17. Apply the correct seam sealer to all joints carefully (Refer to the BODY SEALING LOCATION).
18. Reprime over the seam sealer to complete the repair.

19. After completing body repairs, carefully apply under coating to the front sidemember and fender apron (Refer to the CORROSION PROTECTION).
20. In order to improve corrosion resistance, if necessary, apply an under body anti-corrosion agent to the panel which is repaired or replaced (Refer to the CORROSION PROTECTION).

REMOVAL

NOTE
This procedure is to be used only for repair of minor damage to the front side member and when it is impossible to straighten the damaged side member. The following procedure illustrates a repair for the front left side member. The procedure may also be applied to the front right side-member.

1. Measure and mark the vertical cutlines on front side member inner tooling hole center.

2. Drill out all the spotwelds to separate battery tray leg bracket from front side member.

   NOTE
   1. When spotwelded portions are not apparent, remove paint with a rotary wire brush.

   2. In order to perform cutting and separation of spotwelded points use a spot weld cutter which is larger than the size of the nugget to make a hole only in the panels to be replaced.
3. Cut through the front side member inner and outer at cutlines.
   
   **NOTE**
   Take care not to cut through front side member inner reinforcement.

4. Prepare all surfaces to be welded.

---

**INSTALLATION**

1. Transcribe the front side member inner and outer cutline to the new front side member, cut to length and chamfer butt end to improve weld surface.

2. Drill 8mm holes in new front side member for MIG plug welding.

3. Fit and clamp the front side member inner and outer in place.

4. MIG plug weld all holes and MIG butt weld all seams.

5. Measure each measurement point (Refer to the BODY DIMENSIONS) and correct the installation position.
6. Clean and prepare all welds, remove all residue.
7. Apply the two-part epoxy primer to the interior of the front side member.

8. Apply an anti-corrosion agent as required (Refer to the CORROSION PROTECTION).
9. Prepare the exterior surfaces for priming using wax and grease remover.
10. Apply metal conditioner and water rinse.
11. Apply conversion coating and water rinse.
12. Apply the two-part epoxy primer.
13. Apply the correct seam sealer to all joints carefully (Refer to the BODY SEALING LOCATIONS).
14. Reprime over the seam sealer to complete the repair.
FRONT PILLAR

WELDLING POINTS

- MIG plug welding
-+++ MIG butt welding
-** MIG lap welding
REMOVAL

1. Measure and mark the each cutline on the front outer pillar at 150mm from the roof panel end line as indicated in the illustration.

2. Measure and mark the cutline on front side sill outer panel as shown in the illustration.

3. Depending on the extend of damaged area, it may be possible to determine the cutting range within indicated in the illustration.

4. To remove the front pillar, grind away and drill out all welds attaching the cowl side upper outer panel as shown in the illustration.

NOTE
If it is possible that the cowl side upper outer panel is reusable, be careful not to damage it while removing.
5. Drill out all welds attaching the front pillar to dash and cowl top outer, cowl inner lower panels.
6. Remove spotwelds and lap welds attaching cowl crossmember bar mounting upper bracket to remove front pillar.

7. Before cutting front pillar, be sure to support roof panel.

8. Cut the front pillar through each cutline, taking care not to damage the other panel as illustration.

9. Before cutting the front side sill outer panel, make a rough cut the side sill outer panel only.

**NOTE**
When cutting the front side sill outer panel, be careful not to cut side outer reinforcement.
10. Cut the side outer reinforcement as shown in the illustration.
11. Cut the side outer reinforcement vertical cutline and remove the front pillar.

12. Straighten all flanges as necessary, prepare all surfaces to be welded.

INSTALLATION

1. Transcribe the cutline to the new side inner panel, cut to length and chamfer butt end to improve weld surface.

2. Transcribe the cutline to the new side outer reinforcement and new front pillar, adding 30mm overlap to end and cut to length.
3. Drill 8mm holes along outer panel flanges in production location for attachment to other panels.
4. Transcribe the cutline to the new side inner panel, adding 30mm overlap to end and cut to length.
5. Drill 8mm holes in the side inner panel for MIG plug welding.
6. Fit and clamp the new side inner panel in place for welding.
7. MIG plug weld all holes and MIG butt weld the seams.

8. Temporarily install front pillar outer panel in place.
9. Measure and each measurement point (Refer to the BODY DIMENSIONS) and correct the installation position.
10. If necessary, make temporary welds, and then check to confirm that the closing and fit for windshield glass, door and fender are correct.

11. MIG butt weld front pillar outer panel and side outer reinforcement seams.
12. Reattach the cut away front pillar outer panel section, then MIG butt weld.

13. MIG plug weld all holes and MIG butt weld all seams in the side outer panel.
14. Clean and prepare all welds, remove all residue.
15. Apply body filler to joints and sand as needed.
16. Apply the two-part epoxy primer to the interior of the front pillar.
17. Clean all welds with a disc grinder.

**NOTE**
1. Be careful not to grind welded portions too much.
2. The internal parts will be stronger if the weld traces are not ground.

18. Before welding the cowl side upper outer panel, apply the two part epoxy primer and anti-corrosion agent to the interior of the fender apron panel.

19. Install the cowl side upper outer panel in place.
20. MIG plug weld all holes.
21. Clean and prepare all welds, remove all residue.

22. Apply an anti-corrosion agent to the welded parts and inside of front pillar (Refer to the CORROSION PROTECTION).
23. Prepare exterior surfaces for priming, using wax and grease remover.
25. Apply conversion coating and water rinse.
26. Apply the two-part epoxy primer.
27. Apply the correct seam sealer to all joints carefully (Refer to the BODY SEALING LOCATIONS).
28. Reprime over the seam sealer to complete the repair.
CENTER PILLAR

WELDLING POINTS

- MIG plug welding
- MIG butt welding

50mm

PRO-0730

PRO-0720

PRO-0710
REMOVAL

1. Measure and mark the horizontal cutline on center outer pillar as indicated in the illustration.

2. Measure and mark the vertical cutline on side sill outer panel 30mm from the front door step trim mounting hole.

3. Before cutting center pillar, be sure to support roof panel.

4. Drill out all spotwelds attaching the center outer pillar to the body to remove center outer pillar.
5. Cut through center outer pillar and side sill outer panel at cutlines.

   **NOTE**
   When cutting side sill outer panel take care not to cut through mating flanges or side outer reinforcement.

6. After cutting side outer panel (center outer pillar & side sill), cut the side outer reinforcement and center inner pillar.

7. Remove the center pillar.

   **NOTE**
   When cutting center inner pillar, be careful not to cut front seat belt mounting upper bracket.

8. Determine if the side outer reinforcement is damaged and needs to be replaced. If replacing is necessary, mark out the damaged portion of the reinforcement. Cut at cutlines and remove damaged portion.

9. Straighten all flanges as necessary.

10. Prepare all surfaces to be welded.
INSTALLATION

1. In order to install center inner pillar drill out all spotwelds attaching the roof side inner rail to center inner pillar to separate them.

2. Transcribe the center outer pillar cutlines to the new center outer pillar, adding 30mm overlap at center lower pillar ends.
3. Cut and chamfer butt end to improve weld surface.
4. Drill 8mm holes in overlap area and along outer panel flanges.

5. MIG butt weld all seams in center inner pillar and side outer reinforcement as shown in the illustration.
6. Transcribe the cutline dimensions to the new side outer reinforcement, adding 30mm overlap to each end and cut to length.

7. Drill 8mm holes in overlap areas on each end of new side outer reinforcement and clamp the new side outer reinforcement in place.

8. MIG plug weld all holes and MIG butt weld seams.

**NOTE**
The reinforcement will be stronger if the weld traces are not ground.

9. Temporarily install new center outer panel in place.
10. Screw center pillar in place.
11. Measure and each measurement point (Refer to the BODY DIMENSIONS) and correct the installation position.
12. Check the fit of the front and rear doors.

13. Reinstall center outer pillar and screw in place.
14. MIG plug weld all holes and MIG butt weld all seams.
15. Clean and prepare all welds, and remove all residue.
16. Apply body filler to the outer center pillar seam. Sand and finish.
17. Apply the two-part epoxy primer to the interior of the center pillar.
18. Apply an anti-corrosion agent to the welded parts and interior of the center pillar (Refer to the CORROSION PROTECTION).
19. Prepare exterior surfaces for priming, using wax and grease remover.
20. Apply metal conditioner and water rinse.
21. Apply conversion coating and water rinse.
22. Apply the two-part epoxy primer.
23. Apply the correct seam sealer to all joints carefully (Refer to the BODY SEALING LOCATIONS).

24. Reprime over the seam sealer to complete the repair.
SIDE SILL (ASSEMBLY)

WELDLING POINTS

● MIG plug welding
++ MIG butt welding

REMOVAL

1. Measure and mark vertical cutline from the rear door step trim mounting hole on the rear side sill inner panel.

2. At the front and center pillar, measure and mark horizontal cutlines from the door hinge mounting hole on the side outer panel as shown in the illustration.
3. Cut the side sill outer panel along cutlines. Be careful not to cut mating flanges.
4. Drill out all spotwelds, attaching the side sill outer panel to side outer reinforcement.
5. Remove the side sill outer panel.

6. Determine if the side outer reinforcement is damaged and needs to be replaced, measure cutline on reinforcement as shown in the illustration.
7. Cut side sill outer reinforcement along the cutline.
8. Drill out spotwelds attaching the side outer reinforcement to the body and remove side outer reinforcement.
9. Prepare all surfaces to be welded.

INSTALLATION
1. Transcribe cutline dimension to side sill outer panel, adding 30mm overlap to rear end and cut to length.
2. Drill 8mm holes in overlap area on rear end and along front flange.
3. Fit and clamp the side sill outer reinforcement in place.
4. MIG plug weld all holes and MIG butt weld seams.

5. Before welding the side sill outer panel, apply the two-part epoxy primer and anti-corrosion agent to the welded parts.

NOTE
The reinforcement will be stronger if the weld traces are not ground.
6. Using service panel for replacement of side sill outer panel, drill 8mm holes in overlap areas and along upper and lower flanges.

7. Crimp flanges on the remaining portion of the side sill outer panel at all joint for overlap.
8. Fit and clamp the side sill outer panel in place.
9. MIG plug weld all holes and MIG butt weld seams.
10. Clean and prepare all welds and remove all residue.
11. Apply body filler to the side sill outer seams.
12. Apply the two-part epoxy primer to the interior of the side sill.

13. Apply an anti-corrosion agent to welded parts and interior of the side sill (Refer to the CORROSION PROTECTION).
14. Prepare the exterior surfaces for priming, using wax and grease remover.
15. Apply metal conditioner and water rinse.
16. Apply conversion coating and water rinse.
17. Apply the two-part epoxy primer.

18. Apply the correct seam sealer to all joints (Refer to the BODY SEALING LOCATIONS).
19. Reprime over the seam sealer.
20. Apply the anti-corrosion primer to the side sill outer panel to complete the repair (Refer to the CORROSION PROTECTION).
SIDE SILL (PARTIAL)

REMOVAL

1. Depending on the extent of damage, mark out the damaged portion of the side sill.

2. Drill out the spotwelds in upper and lower flanges of side sill between cutlines to remove side sill outer panel and cut the damaged portion of the side sill at the cutlines.
3. Determine if the side outer reinforcement is damaged and needs to be replaced. If replacing is necessary, mark out the damaged portion of the side outer reinforcement. Cut at cutlines and remove the damaged portion.
4. Prepare all surfaces to be welded.

### INSTALLATION

1. Transcribe the cutline to the new front side outer reinforcement, adding 30 mm overlap to each end and cut to length.
2. Drill 8 mm holes in overlap areas on each end and upper flange of new side outer reinforcement and clamp the new side outer reinforcement in place.

3. MIG plug weld all holes and MIG butt weld all seams.

**NOTE**

The reinforcement will be stronger if the weld traces are not ground.

4. Before welding the side sill outer panel, apply the two part epoxy primer and anti-corrosion agent to the welded parts.

5. Transcribe the side sill outer panel cutline to the new side sill, adding 30 mm overlap to each end, cut and chamfer butt end to improve weld surface.
6. Drill 8 mm holes in overlap areas on each end and along upper and lower flanges of the new side sill outer panel for MIG plug welding.
7. Fit and clamp the side sill in place.
8. MIG plug weld all holes and MIG butt weld seams.
9. Clean and prepare all welds, remove all residue.
10. Apply body filler to the side sill outer seams.
11. Apply the two-part epoxy primer to the interior of the side sill.

12. Apply an anti-corrosion agent to the welded parts and interior of the side sill (Refer to the CORROSION PROTECTION).
13. Prepare the exterior surfaces for priming, using wax and grease remover.
14. Apply metal conditioner and water rinse.
15. Apply conversion coating and water rinse.
16. Apply the two-part epoxy primer.

17. Apply the anti-corrosion primer to the side sill outer panel to complete the repair (Refer to the CORROSION PROTECTION).
QUARTER PANEL

- MIG plug welding
- MIG butt welding
REMOVAL
1. Depending on the extent of damage, measure and mark cutlines on the quarter outer panel as indicated in the illustration.

2. Drill out all attaching spotwelds on the quarter outer panel, including the seam around the door lip opening.
3. Cut the quarter outer panel at cutlines and remove the quarter outer panel as illustration.

NOTE
When cutting the quarter outer panel, be careful not to cut quarter inner panel.

4. Prepare all surfaces to be welded.

INSTALLATION
1. Transcribe the cutline to the new quarter outer panel, adding 30 mm for overlap at the old joint.
2. Drill 8 mm holes in overlap areas and along upper and lower flanges of the new quarter outer panel for MIG plug welding.
3. Fit and clamp the quarter outer panel in place.
4. MIG plug weld all holes and MIG butt weld seams. At the wheel well the edge must be crimped over the wheel housing. This joint may be welded after crimping or applying a bead of adhesive which may be applied to the joint before or after crimping.
5. Clean and prepare all welds, remove all residue.
6. Apply body filler to the welded seam. Sand and finish. Apply the two-part epoxy primer to the interior of the quarter outer panel.

7. Apply an anti-corrosion agent to the welded parts and interior of the quarter outer panel (Refer to the CORROSION PROTECTION).
8. Prepare exterior surfaces for priming, using wax and grease remover.
9. Apply metal conditioner and water rinse.
10. Apply conversion coating and water rinse.
11. Apply the two-part epoxy primer.

12. Apply the correct seam sealers to all joints.
13. Reprime over the seam sealer to complete the repair.

14. In order to improve corrosion resistance, if necessary, apply an under body anti-corrosion agent to the wheel well (Refer to the CORROSION PROTECTION).
REAR FLOOR

WELDLING POINTS

- MIG plug welding
- MIG butt welding
NOTE
Because the rear side members are designed to absorb energy during a rear collision, care must be taken when deciding to use this repair method. This repair is recommended only for moderate damage to vehicle, where distortions do not extend forward of the trunk region. If the damage is more severe, then the entire side member assembly should be replaced at factory seams without employing this sectioning procedure.

Refer to the body dimension chart and measure the vehicle to determine straightening and alignment requirements. The body must be returned to its original dimension before beginning the repair procedure.

REMOVAL
1. Drill out all the spotwelds attaching the rear floor panel to the wheel housings and rear side members.
2. Remove the rear floor panel
3. Remove the back panel by drilling out all attaching spotwelds.
BODY PANEL REPAIR PROCEDURE - Rear floor and rear side member (assembly)

4. Remove the rear floor panel and rear side member from the rear body.

INSTALLATION

1. Transcribe the cutline to the new rear side members. Drill out the spotwelds attaching the inner reinforcements. Remove remaining portions of side members.

2. Temporarily fit and clamp the rear side members in place.

   **NOTE**
   When installing the rear floor side member, temporarily install the back panel to measure each measurement point.

3. Measure each measurement point (Refer to BODY DIMENSIONS) and correct the installation position.

4. If necessary, make temporarily welds, and then check to confirm that the fit of rear floor panel is correct.
5. MIG plug weld the rear side members and MIG butt weld seams.
6. Prepare the welds and surfaces to which the rear floor will attach.
7. Transcribe the cutline to the new rear floor panel, adding 30mm for overlap at the old joint.

8. Drill 8mm holes in overlap area and production locations of the new rear floor panel for MIG plug welding.
9. Fit and clamp the rear floor panel and attach the rear floor panel to the rear side members and other panels.

10. MIG plug weld all holes and MIG butt weld the seams.
11. Clean all welded surfaces.
12. Drill 8 mm holes on the flange attaching the back panel to the rear floor and side member ends.

13. Fit and clamp the back panel in place.
14. MIG plug weld the back panel.
15. Clean and prepare all welds, remove all residue.
16. Apply the two-part epoxy primer to the interior of the rear side members.
17. Apply an anti-corrosion to the interior of the rear side members (Refer to the CORROSION PROTECTION).
18. Prepare exterior surfaces for priming, using wax and grease remover.
19. Apply metal conditioner and water rinse.
20. Apply the two-part epoxy primer.

21. Apply the correct seam sealer to all joints (Refer to the BODY SEALING LOCATIONS).
22. Reprime over the seam sealer to complete the repair.

23. After completing body repairs, carefully apply under coating to the under body (Refer to the CORROSION PROTECTION).
24. In order to improve corrosion resistance, if necessary, apply an under body anti-corrosion agent to the panel which is repaired or replaced (Refer to the CORROSION PROTECTION).
REAR SIDE MEMBER (PARTIAL)

**WELDING POINTS**

- MIG plug welding
- MIG butt welding

**REMOVAL**

**NOTE**

Because the rear side members are designed to absorb energy during a rear collision, care must be used when deciding to use this repair method. This repair is recommended only for moderate damage to the vehicle, where distortions do not extend forward of the trunk region. If the damage is more severe, then the entire side member assembly should be replaced at the factory seams without employing this sectioning procedure.

The following procedure applies when only one rear side member needs to be replaced. If both side members are damaged and need to be replaced, then the procedure of Rear Side members And Rear Floor Section should be followed.

Refer to the body dimension charts and measure the vehicle to determine straightening and alignment requirements. The body must be returned to its original dimensions before beginning the repair procedure.
1. Depending on the extent of damage, if the right side member is to be replaced it should be measured and marked 30mm from the rear floor side member tooling hole center.

**NOTE**
The following procedure illustrates a repair for the right rear side member. The procedure may also be applied the left rear side member.

2. Cut through rear side member at cutline being careful not to cut rear side member reinforcement.
3. Remove the rear floor side member by drilling out all attaching spotwelds.
4. Prepare all surfaces to be welded.

**INSTALLATION**

1. Transcribe the cutline to the new rear side member. Cut at line and drill out the spotwelds attaching the inner reinforcement and separate it.

2. Fit and clamp the new rear side member in place for welding. Measure to ensure dimensions are accurate as given in the body dimension charts.
3. MIG plug weld at the holes and MIG butt weld the seam in the side member.
4. Clean and prepare all surfaces to be welded and remove all residue.
5. Apply the two-part epoxy primer to the interior of the rear side member.
6. Apply an anti-corrosion to the interior of the rear side member (Refer to the CORROSION PROTECTION).

7. Prepare exterior surfaces for priming, using wax and grease remover.

8. Apply metal conditioner and water rinse.

9. Apply conversion coating and water rinse.

10. Apply the two-part epoxy primer.

11. Apply the correct seam sealer to all joints (Refer to the BODY SEALING LOCATIONS).

12. Reprime over the seam sealer to complete the repair.

13. After completing body repairs, carefully apply undercoating to the under body (Refer to the CORROSION PROTECTION).

14. In order to improve corrosion resistance, if necessary, apply an underbody anti-corrosion agent to the panel which is repaired or replaced (Refer to the CORROSION PROTECTION).
FRONT AND REAR DOOR OUTER PANELS

WELDLING POINTS

FRONT DOOR

CON-0750

REAR DOOR

CON-0800

- MIG plug welding
- MIG lap welding
REMOVAL

1. Cut door outer panel hem with a sander.
2. After grinding off the hemming location, remove the outer panel.

3. Dress rusty part with a sander and prepare surface to be hemmed.

INSTALLATION

1. Apply adhesive or equivalent to outer panel hem.
2. Apply mastic sealer or equivalent to the door upper member and door reinforcement beam as shown in the figure.
3. Bend the flange hem with a hammer and dolly, then fasten tightly with a hemming tool.

**NOTE**
1. Hemming work should be done in three steps as illustration.
2. If a hemming tool cannot be used, hem with a hammer and dolly.

4. After completing the hemming work, make MIG spot welds at 50 mm intervals on the inside.
5. Clean and prepare all welds, remove all residue.
6. Apply the two-part epoxy primer to the interior of the door panel.
7. Apply an anti-corrosion agent to the welded parts and lower inside of the door panel (Refer to the CORROSION PROTECTION).

8. Prepare exterior surfaces for priming, using wax and grease remover.

9. Apply metal conditioner and water rinse.

10. Apply conversion coating and water rinse.

11. Apply the two-part epoxy primer.

12. Apply the correct seam sealer to whole panel edge.

13. Reprime over the seam sealer to complete the repair.
BODY SEALING

| 34. Battery tray leg reinforcement | 68. Front door frame rear reinforcement |
ZINC-PHOSPHATE COAT & CATIONIC ELECTRODEPOSITION PRIMER

In order to improve the adhesion of the paint coat on the steel panel, and also to improve the corrosion resistance, the entire body is coated with a film of Zinc-phosphate and a cationic electrodeposition primer.
ANTI-CORROSION PRIMER

An anti-corrosion primer has been applied to the side sill outer panel for the purposes of corrosion prevention and abrasion protection. If this panel is replaced, apply an anti-corrosion primer between the undercoat and the intermediate coat, as shown in the following illustrations.

SECTION A-A'

Rock panel primer (Thickness 180 µ ~ 200 µ)
ATTACHMENT OF ANTIVIBRATION PADS

Antivibration pads are attached to the upper surface of the floor and at the interior side of the dash panel in order to absorb vibrations and shut out exhaust gas heat. If these antivibration pads are peeled off in the course of replacement or repair of a welded panel, cut and attach replacement material (in the shape shown in the figure).

1. Heat the "antivibration pad" with a blow drier to soften it.

2. Align the antivibration pad layer in the position where it is to be installed, and then press it down with a roller or a block of wood so that it adheres well.

NOTE
An infrared lamp can also be used to heat both the antivibration pad layer and the body panels (be sure to wear gloves).
UNDER BODY COAT

In order to provide corrosion, stone chipping and vibration resistance, under body coat is applied to the under sides of the floor and wheel house. Therefore, when such panel is replaced or repaired, apply under body coat to that part.

FLOOR

★ Because parts are to be mounted in these locations, mask the location, before applying the under body coat.

UNDER BODY COATING (Thickness 0.8 mm - 2.0 mm)

SECTION A-A’

SECTION B-B’

SECTION C-C’

SECTION D-D’
Because parts are to be mounted in these locations, mask the location before applying the under body coat.

Under body coating (Thickness 1.0 mm - 2.0 mm)
CAVITY WAX INJECTION

In order to provide greater corrosion resistance, cavity wax injection has been performed for the lower areas of the vehicle, such as the sidemember, the side sill and the inside of other panels which are a hollow construction. When replacing these parts, be sure to apply cavity wax to the appropriate areas of the new parts.

★ Wax injection must be done through access holes marked.

Cavity wax injection (Thickness 40 µ - 50µ)
Wax injection must be done through access holes marked.

Cavity wax injection (Thickness 40µ - 50µ)
Wax injection must be done through access holes marked.

Cavity wax injection (Thickness 40µ - 50µ)

SECTION A-A'
UNDER BODY ANTI-CORROSION AGENT

The undersides of the floor and wheel house are undercoated to provide greater corrosion resistance. Therefore, when such panel is replaced or repaired, apply under body anti-corrosion agent to that part.

NOTE
Do not apply the under body anti-corrosion agent to come in contact with tires, muffler and exhaust pipe.
